

CRP Dryland Systems

Technical report – 2014

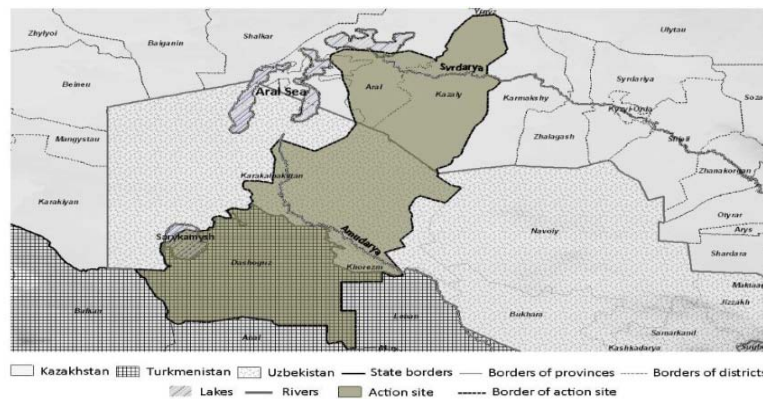

Cluster of activity

Identify and introduce stress tolerant, high-yielding and improved quality varieties of cereals, potato, vegetable, horticultural, fodder crops through on-farm adaptive trials.

Reporting Center: ICARDA

Supporting CRP: CRP WHEAT

Action site: Aral Sea Region

Problem addressed:

Salinity and frost are two important perennial abiotic constraints to successful winter wheat cultivation in Aral Sea region. There are limited options of salinity and frost tolerant winter wheat varieties to the farmers in the region.

Outputs

1. Two hundred nine improved winter wheat germplasm were evaluated on medium level saline field under frost conditions.
2. A second set of 150 winter wheat varieties and advanced breeding lines were evaluated for frost tolerance under two (2-cm and 4-cm) seeding depths.

Outcomes:

1. Twenty five winter wheat genotypes superior to the local check in performance were identified.
2. Six candidate cultivars of winter wheat were identified.
3. Ninety seven frost tolerant improved winter wheat germplasm were identified.
4. Planting wheat at 4 cm depth provides better frost protection than shallower depth.

Partners:

- Research Institute of Crop Husbandry (KRICH), Chimbay – implementation of activity by conducting the field trials.
- Khorezm Rural Advisory Support Services (KRASS), Urgench - implementation of activity by conducting the field trials.
- Kashkadarya Research Institute of Grain Breeding and Seed Production, Karshi – providing germplasm for field trials.
- Uzbek Research Institute of Plant Industry, Kibray – support in supervision of field trials and data collection.
- District Administration, Chimbay District – administrative support in successfully completing the field trials.

Experiment 1: Performance of salinity tolerant winter wheat varieties

Objective:

Identify high yielding salinity and frost tolerant winter wheat varieties for Aral Sea region, compared to the locally grown commercial varieties.

Materials and methods

Number of location: 2 (Chimbay and Urgench)

Number of varieties evaluated: 20 (Table 1)

- 17 experimental line previously selected for salinity tolerance in Karshi and Urgench, Uzbekistan under BMZ funded project on salinity tolerant winter wheat
- Three checks:
 - Krasnodar-99 (grown locally)
 - Yaksart (new high yielding variety developed for other parts of Uzbekistan)
 - Shams (a candidate cultivar submitted to the State Variety Testing Commission in 2014)

Experimental design: RCBD in two reps.

Plot size: 10 m²

Planting date: 23 September 2013

Characters evaluated: frost kill (%), grain yield, 1000-kernel weight (TKW), days to heading (DHD), days to maturity (DMT), plant height, different quality traits, and visual field selection.

Results and discussion

- Frost occurred during third week of February when temperatures reached around -25°C for several days in Chimbay.
- Seven experimental lines were severely affected by frost in Chimbay (Table 1)
- Four (Genotype 6, 12, 13 and 17) of the 17 experimental lines showed 55 to 93% frost kill (Table 1).
- In Urgench, there was less effect of frost, and eight susceptible wheat genotypes suffered from frost injury, and recovered later but not to full extent (Table 2).
- The wheat genotypes varieties differed significantly for grain yield at both locations (Table 1 and Table 2).
- The experimental genotypes 10 and 20 were superior for yield at both locations.
- The newly released variety Yaksart showed high yield at both locations.

Experiment 2: Performance of salinity and frost tolerant winter wheat varieties

Objective:

Identify high yielding salinity and frost tolerant winter wheat varieties for Aral Sea region, compared to the locally grown commercial varieties.

Materials and methods

Location: Chimbay

Number of varieties evaluated: 15 (Table 3)

- 14 experimental lines previously selected for salinity tolerance in Karshi and Urgench, and frost tolerance in Urgench, Uzbekistan under BMZ funded project on salinity tolerant winter wheat for Central Asia.
- One check:
 - Krasnodar-99 (most widely grown locally)

Experimental design: RCBD in two reps.

Plot size: 50 m²

Planting date: 23 September 2013

Characters evaluated: frost kill (%), grain yield, days to heading (DHD), plant height and selection in the field.

Results and discussion

- All 15 genotypes were frost tolerant.
- Three experimental genotypes (UZ10MLY-14, UZ10MLY-20 and Kiriya) yielded significantly higher than
- UZ10MLY-20 was selected as the most superior varieties in the field by the farmers. This has also been selected in the field by the researchers.

¶ Mean grain yield of the genotypes followed the letter 'a' is significantly higher than the local check (Krasnodar-99) based on LSD_{0.05}.

Experiment 3: Frost tolerance winter wheat varieties and advanced breeding lines adapted to Central Asia

Objective:

Identify high yielding salinity and frost tolerant winter wheat varieties for Aral Sea region, compared to the locally grown commercial varieties.

Materials and methods

Location: Chimbay

Number of varieties evaluated: 169 (Table 4)

- 17th IWWYT-IR received from IWWIP (International Winter Wheat Improvement Program)

Experimental design: One replication.

Plot size: 1 m²

Planting date: 23 September 2013

Characters evaluated: frost kill (%), grain yield, 1000, days to heading, days to maturity, and plant height.

Results and discussion

- Frost occurred during third week of February when temperatures reached around -25C for several days in Chimbay.
- Around 51% (87 out of 169) of the genotypes were frost tolerant (<10% frost kill).
- Among 169 genotypes, 70 (41%) didn't show any frost kill, plus additional 17 (10%) had <10% frost kill (Table 4).
- Based on grain yield, days to heading, days to maturity and grain physical appearance, 19 superior genotypes from among the frost tolerant ones were selected to plant in 2015 for further evaluation (Table 4).

Table 4. A set of 169 winter wheat genotypes in the 17th FAWWON-IRR (17th Facultative and Winter Wheat Observation Nursery for Irrigated Environments) evaluated for frost tolerance and agronomic performance in Chimbay, Uzbekistan, 2013-2014.

Experiment 4: Performance demonstration of newly released cultivars and pipeline varieties of winter wheat under saline and frost conditions

Objective:

Determine the effect of seeding depth on frost tolerance in winter wheat.

Materials and methods

Location: Chimbay

Number of varieties evaluated: 150 (Table 5)

- Released cultivars and advanced breeding lines adapted to Central Asia.

Experimental design: Alpha lattice, two reps

Depth of seeding : 2 cm and 4 cm

Plot size: 1 m², 100 seeds planted

Planting date: 23 September 2013

Characters evaluated: Frost kill (%) determined by seedling count before and after winter season

Results and discussion

- Frost occurred during third week of February when temperatures reached around -25C for several days in Chimbay.
- A large number of lines were tolerant to frost (Table 5)
- A summary of the number of lines showing <10% and <20% frost kill is given below.

Frost kill	Seeding depth	
	2-cm	4-cm
Number of lines with $\leq 20\%$ frost kill	38 (25%)	97 (65%)
Number of lines with $\leq 10\%$ frost kill	25 (17%)	75 (50%)

Table 5. Evaluation of commercial varieties and advance breeding lines of winter wheat for frost tolerance in Chimbay, Uzbekistan, 2013-2014

Experiment 5: Evaluation of newly released and pipeline varieties of winter wheat under saline and frost conditions

Objective:

Demonstrate comparative performance of new and pipeline varieties of winter wheat to provide options of stress tolerant varieties to the wheat growers in Aral Sea region.

Materials and methods

Number of location: 2 (Chimbay and Urgench)

Number of varieties evaluated: 10 (Table 6)

- Five experimental line previously selected for salinity tolerance in Karshi and Urgench, and frost tolerance in Urgench, Uzbekistan under BMZ funded project on salinity tolerant winter wheat for Central Asia
- Five commercial varieties:
 - Krasnodar-99 (widely grown locally)
 - Tanya (widely grown locally)
 - Yongbosh (old check)
 - Yaksart (new variety)
 - Turkiston (new variety)

Experimental design: One replication

Plot size: 50 m²

Planting date: 23 September 2013

Characters evaluated: frost kill (%), grain yield, days to heading, days to maturity and visual field selection.

Results and discussion

- Frost occurred during third week of February when temperatures reached around -25°C for several days in Chimbay.
- All genotypes were frost tolerant in Chimbay (Table 6).
- The new variety “Yaksart” and pipeline variety “Salinity En-49” yielded higher than both local checks (Krasnodar-99 and Tanya at both locations).
- Farmers’ evaluated the crop in late grain filling stage and ranked new variety “Yaksart” and pipeline variety “Salinity En-49” superior to the local checks.

Table 6. Performance of newly released and pipeline varieties of winter wheat under saline and frost conditions in Chimbay and Urgench, Uzbekistan, 2013-2014

Entry No.	Variety name	Winter kill (%)	Days to heading	Days to maturity	Plant height (cm)	Grain yield (t/ha)		Farmers' preference at late grain filling stage
